

Android Application Project

Build an Android application with two tabs, one of which displays in a table the top 20 YouTube search results for “key and peelee”.

Requirements

- While the videos are loading, it should be possible to switch to the other tab (which can be blank) – i.e. the UI should never be blocked.
- Clicking on a cell in the table should play the video in the app in some way – embedded, in a popup, or full screen.

Submission

- Send a link to a (public) git repository containing all the app files. The app should build and run on a Samsung Galaxy S4 Mini Android emulator, on a computer besides the one on which it was developed.
- You should create the git repository before you start work on the app, and commit and push your changes as you work on it. You don’t need to have more than a few commits.
